

Appendix D - Power Spectral Density Plots for TSH 2 (0 – 150 Hz)

SAMS-FF TSH 2 data collected during the STS-95 mission were used to generate the PSD plots in this appendix. These data were collected at a rate of 400 samples per second with an effective lowpass filter cutoff frequency of just over 100 Hz. The data in these PSDs are plotted out to a maximum frequency of 150 Hz. The plots are from recording sessions 3 through 43, with each plot comprised of 255 seconds worth of data. The time resolution used to compute the PSD plots was approximately 82 seconds, and the frequency resolution was 0.0122 Hz. To produce the PSD plots, a Hanning window was used for successive time intervals and the resultant PSDs were averaged together to create the plots. The parameter k indicates the number of PSDs averaged together to produce the plots. Because axial relationships were particularly important to the HOST project, the PSDs were calculated for all three axes.

These PSDs are intended to provide a snapshot of the frequency domain environment for each recording session. Those interested in further details are encouraged to contact the PIMS team.

SUMMARY REPORT OF MISSION ACCELERATION MEASUREMENTS FOR STS-95
